‡ Health Visitors' Certificate

Consultants (Part-time):

K. V. Bailey, M.C., M.D., M.R.C.P., F.R.C.O.G......Obstetrician
G. E. Hayward, M.B., M.R.C.S......Ear, Nose and Throat Surgeon
J. Holt, M.R.C.V.S......Veterinary Surgeon

*Mrs. Dickinson.....Puerperal Nurse

Clerical Staff:

S. Cunningham (Senior). Gla Hilda M. Dixon. He

Gladys M. Davies. Helen Mulrooney.

The clerical staff is engaged jointly in Health, Maternity and Child Welfare and School Medical Work.

Public Health and School Medical Department, Town Hall,

Leigh,

Lancashire.

November, 1941.

To the Chairman and Members of the Health and Maternity and Child Welfare Committees.

Messrs. Chairmen, Ladies and Gentlemen,

I have the honour to present my annual report as Medical Officer of Health. The report has reference to the year 1940.

There has been an increased mortality from bronchitis, tuberculosis and heart disease during the year.

Sixteen fatal cases of diphtheria occurred. These could have been prevented by immunization. Attention is drawn to delay in obtaining medical attention as a factor in diphtheria mortality.

The energies of the department were in large measure directed towards the organisation of the Air Raid Precautions Casualty Service.

Before concluding I wish to pay tribute to the help I have received from the Chairmen and individual members of the Health and Maternity and Child Welfare Committees and also to the loyal co-operation of the members of my staff.

I have the honour to be,

Your obedient Servant,

H. J. PETERS.

SECTION A.—STATISTICS AND SOCIAL CONDITIONS OF THE AREA

The Borough covers an area of 6,359 acres.

The Registrar-General's estimate of the resident population at mid-year 1940 was:—

Population	45,240
,, (Census) 1931	45,317
No. of inhabited houses, end of 1940,	,
according to rate books	_14,068
Rateable value	£242,613
Sum represented by Penny Rate	£945

Social Conditions.

The inhabitants are largely of the working class, coal mining employing the largest number of any single occupation. This is closely followed by textile workers.

The percentage of insured persons unemployed in December, 1940, was 2.1 compared with 9.3 in December, 1939.

Comments on Vital Statistics for the year 1940.

The maternal mortality rate during the current year is 2.69 and this shows a reduction on the previous year's figure of 2.82. The maternal mortality rate for England and Wales as a whole for 1940 is 2.16; the figure for the previous year was 2.82. This reduction in the national maternal mortality rate to a new low level has been in part attributed to the setting up of wartime maternity hostels in the reception areas. The reduction in our own rate is contemporaneous with a large increase in the number of cases dealt with by the municipal midwives.

The infant mortality rate is 69. During the previous year it was 71. The national figure for the current year is 55 which compares with a figure of 50 for the previous year.

There has been a slight increase in the incidence of diphtheria during the year. The number of cases notified was 178 and of these 16 proved fatal. During the previous year there were 163 cases of which 10 proved fatal.

An investigation in regard to the mortality from diphtheria during August, September and October of 1940 revealed that ninety per cent of the cases admitted to hospital during September did not obtain medical advice till the third day of the disease or later; the similar figure for August is forty-seven per cent and for October sixty-two per cent.

Four deaths occurred during the period under review and these all took place in September. Of the four fatal cases, three did not obtain medical advice until the fourth day of the disease and the remaining one did not do so till the third day. Delay in obtaining medical advice conderably diminishes the patient's chance of recovery and may also assist in spreading the disease. While it is recognised that diphtheria may be a latent disease in its initial phase it cannot be too strongly emphasised that medical advice should be sort immediately when a child develops a sore threat.

The 16 deaths from diphtheria could all have been prevented by immunisation. Only thirty-five persons were immunised during the year. Parents are earnestly requested, in the interest of their children, to make full use of the facilities for immunisation which is carried out free of cost to themselves.

The number of cases of measles and whooping cough notified during the year was 1330 and 92 respectively. There were 10 deaths from measles and one from whooping cough.

The adjusted death rate for the Borough is 16.65. The figure for 1939 was 15.47. The adjusted death rate for the borough is comparable with the crude death rate for the country as a whole, which is 14.3 and compares with a rate of 12.1 for the previous year. Thus the crude death rate for England and Wales shows an increase on last year's figure. In noting this it should be remembered that civilian casualties due to enemy action are taken into account when calculating the death rate.

During the year there was a decrease in the mortality from cancer. Sixty-seven persons died from this disease compared with seventy-three during the previous year.

There is a large increase in the mortality from bronchitis. Eighty-eight deaths were ascribed to this cause as against forty-four during the previous year. Not since 1925 have such a large number of deaths been due to this cause. The severe weather conditions which prevailed

towards the end of 1939 and during 1940 probably bear some relation to this increased mortality. Bronchitis this year replaces cancer as the second most important cause of death.

During the past few years the mortality from heart disease has tended to remain at a comparatively high level. In 1940 one hundred and twenty-three deaths were due to this cause compared with ninety-nine in the previous year. This is the highest number of deaths from heart disease that has been recorded during the past twenty years.

SECTION B.—GENERAL PROVISION OF HEALTH SERVICES FOR THE AREA.

Staff.

Full particulars regarding the Public Health Officers of the Authity are incorporated at the beginning of the report.

Laboratory Facilities.

The bacteriological examination of throat swabs is carried out at the laboratory in Astley Sanatorium.

The table below shows the examinations made for the presence of diphtheria bacilli and the results obtained.

	Positive	Negative	Total
Throat swabs	38	154	192
Nasal swabs	13	37	50

Five widal reactions were also performed at this laboratory during the year.

The Tuberculosis Officer arranges for the bacteriological examination of sputum in connection with the diagnosis of pulmonary tuberculosis.

Water samples are submitted to Manchester University Public Health Laboratory for chemical and bacteriological examination.

The bacteriological examination of milk samples is also carried out at this laboratory.

Ambulance Arrangements.

Four ambulances are provided by the Local Authority for the removal of non-infectious medical, maternity and accident cases. These ambulances are under the control of the Medical Officer of Health.

Infectious cases are removed to the Isolation Hospital at Astley by the ambulances of the Leigh Joint Hospital Board. These are housed at the Isolation Hospital.

Nursing in the Home.

There are three district nurses working in the area. They attend patients at the request of the medical practitioners. They are not available for the nursing of cases of infectious disease and they do not act as midwives or maternity nurses.

The health visitors give assistance in the home nursing of cases of measles, whooping cough and ophthalmia neonatorum.

A special nurse is available for the home nursing of cases of puerperal pyrexia. As a rule, however, such cases are removed to Astley Sanatorium.

At the end of the current year only two midwives were in private practice in the borough.

Treatment Centres and Clinics.

The arrangements regarding treatment centres and clinics remain the same as in previous years.

Hospitals — Public and Voluntary.

During the year it was decided to accept financial responsibility for abnormal obstetrical cases admitted from the borough to the Hope Hospital, Salford and St. Mary's Hospital, Manchester. The decision was taken in view of the fact that there are no adequate hospital facilities for these cases within the borough.

The Municipal Maternity Home has eighteen beds for maternity cases; at Leigh Infirmary there are three beds for maternity cases and six beds are available at the Public Assistance Institution, just outside the borough boundry.

The only voluntary hospital in the borough area is the Leigh Infirmary.

The Local Authority contributes to the Manchester and Salford hospitals, which received many patients from the borough.

Midwifery Service.

Four Municipal Midwives are employed by the Corporation. They delivered 303 cases during the year either in the capacity of midwife or maternity nurse. The number of cases dealt with by the municipal midwives during the previous year was 158. It will thus be apparent that there has been a marked increase in the work of the municipal midwifery service and this will in all probability necessitate the employment of another municipal midwife in the near future.

Maternity Service.

There is a decrease in the number of cases admitted to the Municipal Maternity Home. There were 472 admissions compared with 512 during 1939. This decrease is entirely due to the efforts made to prevent overcrowding in the Home. Many patients had to be refused admission because of lack of sufficient accommodation and it is quite evident that the Home is too small for the area it serves.

The following are the statistics for the Home for the year 1940:—

Patients admitted	• • • •	472
Live Births		451
Stillbirths		12
Total Births	• • • •	463
Normal deliveries		378

St. Mary's Hospital, Manche	ester	1
Transferred after delivery —		
Hope Hospital	• • • •	1
Leigh Infirmary		1

Health Visitors.

Five full-time Health Visitors are employed by the Borough.

The Health Visitors made 3709 home visits to infants and preschool children during the year.

The following is a summary of their work.

Primary Visits	$\begin{cases} under 1 \ year \\ over 1 \ year \end{cases}$	592	594
Revisits	\begin{cases} \text{under 1 year} \\ \text{over 1 year} \end{cases}	$ \begin{array}{c} 1205 \\ 1910 \end{array} $	3115

Child Life Protection.

The Health Visitors undertake the supervision and protection of children under the Children and Young Persons Act, 1932.

Arrangements for Dental, Orthopaedic, etc. cases.

All the facilities provided for the school children of the Borough are available to pre-school children suffering from dental, orthopaedic and other defects. Dental treatment is available for expectant mothers.

SECTION C.—SANITARY CIRCUMSTANCES OF THE AREA.

The drainage from a farm in the borough entered a collecting tank. The overflow from this tank made its way into a neighbouring brook and gave rise to a considerable nuisance. The drainage, including the overflow from the collecting tank, is now being connected to a sewer and the work will be completed in 1941.

Closet Accommodation.

Below are set out particulars regarding the closet accommodation in the borough.

Fresh water closets	13,187
Waste water closets	432
Privies (no water supply or sewer available)	57
Pail closets (no water supply or sewer	
available)	6

During the year 29 waste water closets were converted to fresh water closets.

Public Cleansing.

The arrangements for the collection and disposal of house refuse remain the same as in previous years. The cleansing Superintendent informs me that 14,700 moveable ashbins were emptied on 744,669 occasions.

Four hundred and thirty tons of refuse were dealt with at the destructor and 8,974 tons were delivered to tips in the borough.

Sanitary Inspection of the Area.

Shops.

During the year 45 inspections were made and one notice was served.

The improvement required was obtained.

Rats and Mice Destruction.

The annual report of the Rat Officer for the year under review shows 281 visits were paid to infested premises and a total of 1,952 rats destroyed. The services of three rat catchers are available to the public, the Council providing each with two dog licences, three ferrets and the requisite netting.

Canal Boats.

The number of boats on the register at the end of the year, which could reasonably be believed to be in use, or available for use was 22.

Four boats were inspected during the year, and there were three infringements of the Canal Boats Acts.

Factories, Workshops and Workplaces.

General Remarks.

No representations were made under the Housing Act during the year, but three areas, Warrington Road (No. 3) consisting of 4 houses, Chapel Street (No. 3) consisting of 6 houses and Green Lane (No. 2) of five houses, represented in 1939 were confirmed by the Minister of Health.

Before the inhabitants of those areas were re-housed their furniture was disinfested with hydrogen cyanide gas.

Following complaints of infestation with bugs, elever houses were also disinfested with hydrogen cyanide gas. The work was done by a firm specialising in this method of disinfestation and the usual precautions were observed.

SECTION E.—INSPECTION AND SUPERVISION OF FOOD.

Milk Supply.

During the year, 98 sam ples of milk were submitted for bacter-iological examination. Of these 12 were examined for the presence of tubercle bacilli and in three instances the results obtained were positive.

In one instance Tuberculin Tested milk was found to contain tubercle bacilli, thus illustrating the point that the designation "Tuberculin Tested" does not necessarily signify that the milk so designated is free from tubercle bacilli.

In another instance a sample of milk obtained immediately prior to pasteurisation was found to contain tubercle bacilli; a sample taken from the same milk soon after pasteurisation was found to be free from tubercle bacilli.

There can be no doubt that efficient pasteurisation is the best means of ensuring a safe milk supply. Milk which has not been pasteurised (even though it is Tuberculin-Tested) should be boiled before use.

The sanitary inspectors paid 317 visits to farms and dairies.

The number of distributors of design ated milk is as follows:—

Pasteurised		• • • •	• • • •	4
Tuberculin Tested	• • • •		• • • •	9
Accredited	• • • •		• • • •	2

The number of cowkeepers on the register at 31st December was 35 and the number of retail purveyors 123.

Adulteration.

The following are details of the samples taken under the Food & Drugs Act, 1938.

No prosecutions were undertaken during the year on the samples submitted.

The average fat content of the samples of milk collected in the borough during the year was 3.77 per cent. The similar figure for solids-not-fat was 8.80 per cent and for total solids 12.57-per cent.

SECTION F.—PREVALENCE AND CONTROL OVER, INFECTIOUS AND OTHER DISEASES.

During the year only 35 children were immunised against diphtheria. Parents are strongly urged to make a fuller use of the facilities for immunisation.

Tuberculosis.

It has not been found necessary to enforce the provisions of the Public Health (Prevention of Tuberculosis) Regulations, 1925.

The ratio of non-notified tuberculosis deaths to total tuberculosis deaths is 1 in 35.

There were 35 deaths from Tuberculosis and this represents a considerable increase on the previous year and indeed is the highest recorded for the past seven years. Thirty-one deaths were due to pulmonary tuberculosis and of this number 10 were notified during 1940 and 8 during 1939. 45.7 per cent of the notified deaths from pulmonary tuberculosis died within twelve months of notification.
